

Package ‘jpgrid’

March 26, 2023

Type Package

Title Functions for the Grid Square Codes in Japan

Version 0.3.1

Description Provides functions for grid square codes in Japan
(<https://www.stat.go.jp/english/data/mesh/index.html>).
Generates the grid square codes from longitude/latitude, geometries, and
the grid square codes of different scales, and vice versa.

as_tbl_grid	<i>Convert a data frame into a tbl_grid object</i>
-------------	--

Description**[Deprecated]****Usage**

```
as_tbl_grid(x, var = NULL, grid_size = NULL, strict = TRUE, ...)
```

Arguments

x	An object to be converted into an object class <code>tbl_grid</code> .
var	A variable to specify the grid object. By default, the first column of the grid object is taken.
grid_size	A grid size.
strict	A logical scalar. Should the number of digits in the grid square code match a given number of digits?
...	Additional arguments passed to <code>tibble::new_tibble()</code> .

Details

It is recommended to use `grid_as_sf()`.

The `tbl_grid` object is a data frame with `grid` objects in the columns. `as_tbl_grid` converts a data frame into a `tbl_grid` object.

Value

A `tbl_grid` object.

<code>bbox_to_grid</code>	<i>Converting bbox to grid square codes</i>
---------------------------	---

Description

Converting bbox to grid square codes

Usage

```
bbox_to_grid(bbox, grid_size)
```

Arguments

<code>bbox</code>	A bbox.
<code>grid_size</code>	A grid size.

Value

A grid vector.

<code>coords</code>	<i>Conversion between grid square codes and coordinates (longitude and latitude)</i>
---------------------	--

Description

Conversion between grid square codes and coordinates (longitude and latitude)

Usage

```
coords_to_grid(X, Y, grid_size)

grid_to_coords(grid, center = TRUE)
```

Arguments

X	A numeric vector of longitude.
Y	A numeric vector of latitude.
grid_size	A grid size.
grid	A grid class vector.
center	Should the center point of the grid be returned? Otherwise the end points will be returned. TRUE by default.

Value

coords_to_grid() returns a grid vector.

grid_to_coords() returns a tbl_df.

geometry_to_grid	<i>Converting sfc geometries to grid square codes</i>
------------------	---

Description

Converting sfc geometries to grid square codes

Usage

```
geometry_to_grid(geometry, grid_size, options = "ALL_TOUCHED=TRUE", ...)
```

Arguments

geometry	A sfc vector.
grid_size	A grid size.
options	Options vector for GDALRasterize passed on to stars::st_rasterize() .
...	Passed on to stars::st_rasterize() .

Value

A list of grid vectors.

grid_as_sf *Converting data frame containing grid square codes to sf*

Description

Converting data frame containing grid square codes to sf

Usage

```
grid_as_sf(  
  x,  
  as_points = FALSE,  
  crs = sf::NA_crs_,  
  grid_column_name = NULL,  
  ...  
)
```

Arguments

x	A data frame or a grid.
as_points	Return the center points of the grids or not?
crs	Coordinate reference system.
grid_column_name	A scalar character.
...	passed on to <code>sf::st_as_sf()</code> .

Value

A sf object.

grid_as_stars *Converting data frame containing regional grids to stars*

Description

Converting data frame containing regional grids to stars

Usage

```
grid_as_stars(  
  x,  
  coords = NULL,  
  crs = sf::NA_crs_,  
  grid_column_name = NULL,  
  ...  
)
```

Arguments

x	A data frame or a grid.
coords	The column names or indices that form the cube dimensions.
crs	Coordinate reference system.
grid_column_name	A scalar character.
...	Passed on to <code>stars::st_as_stars()</code> .

Value

A stars object.

grid_city	<i>List of grid square codes by Japanese municipalities</i>
-----------	---

Description

List of grid square codes by Japanese municipalities

Usage

```
grid_city
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 462915 rows and 6 columns.

Source

https://www.stat.go.jp/data/mesh/m_itiran.html

grid_class	<i>Grid square code vector</i>
------------	--------------------------------

Description

[Deprecated]

Usage

```
grid_80km(x, strict = TRUE)
grid_10km(x, strict = TRUE)
grid_1km(x, strict = TRUE)
grid_500m(x, strict = TRUE)
grid_250m(x, strict = TRUE)
grid_125m(x, strict = TRUE)
grid_100m(x, strict = TRUE)
grid_auto(x, strict = TRUE)
```

Arguments

x	A list or vector.
strict	A logical scalar. Should the number of digits in the grid square code match a given number of digits?

Details

It is recommended to use `grid_parse()` or `grid_convert()`.
A series of functions return grid class for each grid size. `grid_auto()` returns automatically determine grid size by the largest grid size.

Value

A grid vector.

grid_convert	<i>Convert the grid size of grid objects</i>
--------------	--

Description

Convert the grid size of grid objects

Usage

```
grid_convert(grid, grid_size)
```

Arguments

grid A grid vector.
 grid_size A grid size.

Value

A grid vector.

Examples

```
grid_500m <- parse_grid(c("533945263", "533935863", "533945764"), "500m")
grid_convert(grid_500m, "10km")
```

grid_distance	<i>Distance between grid square codes</i>
---------------	---

Description

If grid and grid_to are both vectors, the distance between grid and grid_to is calculated. If grid is a list, The path distance of each element is calculated.

Usage

```
grid_distance(  
  grid,  
  grid_to = NULL,  
  close = FALSE,  
  type = c("keep_na", "ignore_na", "skip_na")  
)
```

Arguments

grid A grid vector or a list of grid vector.
 grid_to A grid vector.
 close Should the path of each element be closed when grid is a list?
 type How is the NA grid treated when grid is a list? "skip_na" skips the NA grid and connects the paths. "keep_na" by default.

Value

A double vector.

grid_line	<i>Draw line segments between grid square codes</i>
-----------	---

Description

If grid and grid_to are both vectors, the line between grid and grid_to is drawn (using Bresenham's line algorithm). If grid is a list, The path lines for each element in the grid will be drawn.

Usage

```
grid_line(grid, grid_to = NULL, close = FALSE, skip_na = FALSE)
```

Arguments

grid	A grid vector or a list of grid vector.
grid_to	A grid vector.
close	Should the path of each element be closed when grid is a list?
skip_na	Should skip the NA grid and connects the paths? FALSE by default.

Value

A list of grid vectors.

grid_move	<i>Moving on grid square codes</i>
-----------	------------------------------------

Description

Moving on grid square codes

Usage

```
grid_move(grid, n_X, n_Y)
```

Arguments

grid	A grid vector.
n_X	Number of moving cells in the longitude direction.
n_Y	Number of moving cells in the latitude direction.

Value

A grid vector.

grid_neighbor	<i>Neighborhood grid square codes</i>
---------------	---------------------------------------

Description

Neighborhood grid square codes

Usage

```
grid_neighbor(grid, n = 1L, moore = TRUE, simplify = TRUE)
```

Arguments

grid	A grid vector.
n	A numeric vector of degrees.
moore	Moore neighborhood (TRUE) or Von Neumann neighborhood (FALSE).
simplify	Should simplify the format of the return?

Value

A list of grid vectors.

grid_subdivide	<i>Subdivide grid square codes</i>
----------------	------------------------------------

Description

grid_subdivide() makes the grid square codes finer.

Usage

```
grid_subdivide(grid, grid_size)
```

Arguments

grid	A grid vector.
grid_size	A grid size.

Value

A list of grid vector.

is_grid	<i>Test if the object is a grid</i>
---------	-------------------------------------

Description

Test if the object is a grid

Usage

```
is_grid(x, grid_size = NULL)
```

Arguments

x	An object.
grid_size	A grid size.

Value

TRUE if the object inherits from the grid class.

jpgrid	<i>Functions for the Grid Square Codes in Japan</i>
--------	---

Description

Provides functions for grid square codes in Japan (<https://www.stat.go.jp/english/data/mesh/index.html>). Generates the grid square codes from longitude/latitude, geometries, and the grid square codes of different scales, and vice versa.

Author(s)

Maintainer: Mizuki Uchida <uchidamizuki@vivaldi.net>

parse_grid	<i>Parse grid square codes</i>
------------	--------------------------------

Description

Parse grid square codes

Usage

```
parse_grid(x, grid_size = NULL, strict = TRUE)
```

Arguments

x	A character vector of grid square codes.
grid_size	A grid size.
strict	A logical scalar. Should the number of digits in the grid square code match a given number of digits? By default, TRUE.

Examples

```
parse_grid("53394526313")
parse_grid("53394526313", "80km")
parse_grid("53394526313", "80km",
          strict = FALSE)
```

XY	<i>Conversion between grid square codes and coordinates (longitude and latitude)</i>
----	--

Description

[Deprecated]

Usage

```
grid_to_XY(grid, center = TRUE)
```

```
XY_to_grid(X, Y, grid_size)
```

Arguments

grid	A grid class vector.
center	Should the center point of the grid be returned? Otherwise the end points will be returned. TRUE by default.
X	A numeric vector of longitude.
Y	A numeric vector of latitude.
grid_size	A grid size.

Value

grid_to_XY() returns a tbl_df.

XY_to_grid() returns a grid vector.
